

# Homework #5

Due date: 18:00, November 14<sup>th</sup>, Monday, 2016

## Problem statement

Let  $F_n$  be the  $n^{th}$  Fibonacci number. Then,

$$\text{LEMMA: } \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix}^n = \begin{bmatrix} F_{n-1} & F_n \\ F_n & F_{n+1} \end{bmatrix} \quad n \geq 1$$

(Proof omitted)

According to this lemma, the  $n^{th}$  Fibonacci number can be computed in  $O(\log n)$  time by the fast exponential algorithm:

Let  $M$  be a  $2 \times 2$  square matrix, then:

$$M^0 = I \quad \text{where } I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \text{ is the identity matrix}$$

$$\begin{aligned} M^n &= M * M^{n-1}, n > 0 \text{ is odd} \\ &= (M^2)^{n/2}, n > 0 \text{ is even} \end{aligned}$$

## Requirements

1. Represent the  $2 \times 2$  square matrix  $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$  by

```
struct matrix { int a,b,c,d; };
```

2. You shall write three functions, say

```
struct matrix mul(matrix m1, matrix m2);  
// compute m1 * m2
```

```
struct matrix pow(matrix m, int n);  
// compute  $M^n$ 
```

```
int F(int n);  
// compute  $F_n$ 
```

3. The input will be in the range of 0~46
4. **Plagiarism is not allowed!**

## Submission

Be sure to upload your source code to E3 by the due date and name your file as “xxxxxxx\_hw5.c”, where xxxxxxx is your student ID.

## Sample run

Enter an integer  $\geq 0$ : 10  
F(10) = 55

Enter an integer  $\geq 0$ : 20  
F(20) = 6765

Enter an integer  $\geq 0$ : 30  
F(30) = 832040

Enter an integer  $\geq 0$ : 40  
F(40) = 102334155

Enter an integer  $\geq 0$ : 46  
F(46) = 1836311903

Enter an integer  $\geq 0$ : ^Z
